

TF-responsive cells ordered by CONTINUOUS kernel width (interp_fwhm, narrow top -> broad bottom) — n=520 cells, no transient/sustained blocks

all responsive cells incl. the 106 intermediate-width cells; PSTH families = mean +/-95% CI per equal-count width bin; pulse sign-aligned BY THE GLM KERNEL (independent of this PETH — 37% suppression-type at this window; window-dependent ~30-40%)

fast TF pulse (sign-aligned) — width families ($\pm 95\%$ CI)

Change_ON (hit trials) — width families ($\pm 95\%$ CI)

FA (early lick) — width families ($\pm 95\%$ CI)
