

TF-kernel latency is largely DECOUPLED from outcome-response magnitude across the population
null when pooled ($\rho \approx 0$, dashed line); a weak POSITIVE relation in BG_046 DMS only, flat/reversed in BG_031 VMS — coloured lines = per-mouse fits

Spearman ρ (kernel latency, response)

[change_on] pooled $\rho = -0.015$ $p = 7.34e-01$
partial = -0.004 ($p = 9.25e-01$) | BG_046
